Geoscience Paper of the Future (GPF) Initiative

<http://www.ontosoft.org/gpf>

- Motivation: Scientists want to learn best practices for software sharing, but prefer to do it while doing research
 - Train paper authors on best practices as they write a Geoscience Paper of the Future (GPF)
- Proposed by members of the OntoSoft Early Career Advisory Committee (~30 members)
 - Covering diverse areas of geosciences

- Training: Developed a 3 hour training session

- Journal Special Issue:

- Write a GPF about new research being done
- Write a GPF to document an already published paper

NATURE REVIEWS | **NEUROSCIENCE**

Scanning the horizon: towards transparent and reproducible neuroimaging research

Russell A. Poldrack¹, Chris I. Baker², Joke Durnez^{1,3}, Krzysztof J. Gorgolewski¹, Paul M. Matthews⁴, Marcus R. Munafò^{5,6}, Thomas E. Nichols⁷, Jean-Baptiste Poline⁸, Edward Vul⁹ and Tal Yarkoni¹⁰

Towards the neuroimaging paper of the future
In this Analysis article, we have outlined a number of problems with current practice and made suggestions for improvements. Here, we outline what we would like to see in the neuroimaging paper of the future, inspired by related work in the geosciences⁷¹.

Why Learn to Write a Scientific Paper of the Future

1. Practice **open science and reproducible research**
2. **Get credit** for all your research products
 - Citations for software, data, containers, notebooks, samples, ...
3. **Increase citations** of your papers
4. Write impressive **Data Management Plans**
5. **Extend your CV** with data and software sections
6. Improve the **management of your research assets**
7. **Reproduce** your work from years ago and build on it
8. Address new **funder and journal requirements**
9. Attract **transformative students**
10. Demonstrate **leadership** by stepping into the future

Training Goals

What Training Covers

- **Best practices**
 - Many are still being developed by the community
- **Major concepts and goals**, regardless of the platform, research area, or target journal
- **Recommendations that are mindful of effort required**
 - How to implement best practices with simplest approach

What is Not Covered

- Metadata standards specific to particular research areas
- Improving software development skills
- Details of using code sharing sites

Scientific Paper of the Future Training

Part I

1. Motivation and overview: open science, reproducible publications, and digital scholarship
2. Making data accessible
3. Making software accessible
4. *PRACTICAL EXERCISE*
5. Documenting software with metadata

Part II

1. Documenting software dependencies
2. Documenting methods and workflows
3. Documenting provenance
4. *PRACTICAL EXERCISE*
5. Summary of author checklist

protocol exchange

Availability of Software

PLOS supports the development of open source software and believes that, for submissions appropriate open source standards will ensure that the submission conforms to (1) our requirement that another researcher can reproduce the experiments described, (2) our aim to promote openness. PLOS journals can be built upon by future researchers. Therefore, if new software or a new dataset that the software conforms to the [Open Source Definition](#), have deposited the following three items with the submission as Supporting Information:

- **The associated source code of the software described by the paper.** This should be licensed under a suitable license such as BSD, LGPL, or MIT (see <http://www.opensource.org/licenses/>). Commercial software such as Mathematica and MATLAB does not preclude a paper from being open access.
- **Documentation for running and installing the software.** For end-user applications, a README file is a prerequisite; for software libraries, instructions for using the application program interface are required.
- **A test dataset with associated control parameter settings.** Where feasible, results from running the software on test data should not have any dependencies — for example, a database dump.

Acceptable archives should provide a public repository of the described software. The code should be available for creating user accounts, logging in or otherwise registering personal details. The repository should contain more than 1,000 projects. Examples of such archives are: [SourceForge](#), [Bioinformatics.Org](#), [Savannah](#), [GitHub](#) and the [Codehaus](#). Authors should provide a direct link to the deposited software.

MEMORANDUM FOR THE HEADS OF EXECUTIVE DEPARTMENTS AND AGENCIES

FROM: John P. Holdren 
Director

SUBJECT: Increasing Access to the Results of Federally Funded Scientific Research

1. Policy Principles

The Administration is committed to ensuring that, to the greatest extent and with the fewest constraints possible and consistent with law and the objectives set out below, the direct results of federally funded scientific research are made available to and useful for the public, industry, and the scientific community. Such results include peer-reviewed publications and digital data.

an approach for optimizing search, archival, and dissemination features that encourages innovation in accessibility and interoperability, while ensuring long-term stewardship of the results of federally funded research;

1, 2015

Background: The prevalence of *Helicobacter pylori* infection is high in the general population of the United States. The prevalence of infection is higher in the African American population than in the white population. The purpose of this study was to determine the prevalence of *Helicobacter pylori* infection in the African American population of the United States.

Methods: 120 African American men aged 40 years (range 30–50) were recruited from a community-based population. The prevalence of *Helicobacter pylori* infection was determined by a combination of a rapid urease test, a histology test, and a polymerase chain reaction (PCR) test. The prevalence of infection was determined by a combination of a rapid urease test, a histology test, and a PCR test. The prevalence of infection was determined by a combination of a rapid urease test, a histology test, and a PCR test.

Results: The prevalence of *Helicobacter pylori* infection was 10.0% (12/120) in the African American population. The prevalence of infection was higher in the African American population than in the white population. The prevalence of infection was higher in the African American population than in the white population.

Conclusions: The prevalence of *Helicobacter pylori* infection is high in the African American population of the United States. The prevalence of infection is higher in the African American population than in the white population. The prevalence of infection is higher in the African American population than in the white population.

Keywords: *Helicobacter pylori*, African American, prevalence, infection, United States

The FAIR Principles

<https://www.force11.org/group/fairgroup/fairprinciples>
doi.org/10.1038/sdata.2016.18

To be Findable:

- F1. (meta)data are assigned a globally unique and eternally persistent identifier.
- F2. data are described with rich metadata.
- F3. (meta)data are registered or indexed in a searchable resource.
- F4. metadata specify the data identifier.

TO BE ACCESSIBLE:

- A1 (meta)data are retrievable by their identifier using a standardized communications protocol.
- A1.1 the protocol is open, free, and universally implementable.
- A1.2 the protocol allows for an authentication and authorization procedure, where necessary.
- A2 metadata are accessible, even when the data are no longer available.

TO BE INTEROPERABLE:

- I1. (meta)data use a formal, accessible, shared, and broadly applicable language for knowledge representation.
- I2. (meta)data use vocabularies that follow FAIR principles.
- I3. (meta)data include qualified references to other (meta)data.

TO BE RE-USABLE:

- R1. meta(data) have a plurality of accurate and relevant attributes.
- R1.1. (meta)data are released with a clear and accessible data usage license.
- R1.2. (meta)data are associated with their provenance.
- R1.3. (meta)data meet domain-relevant community standards.

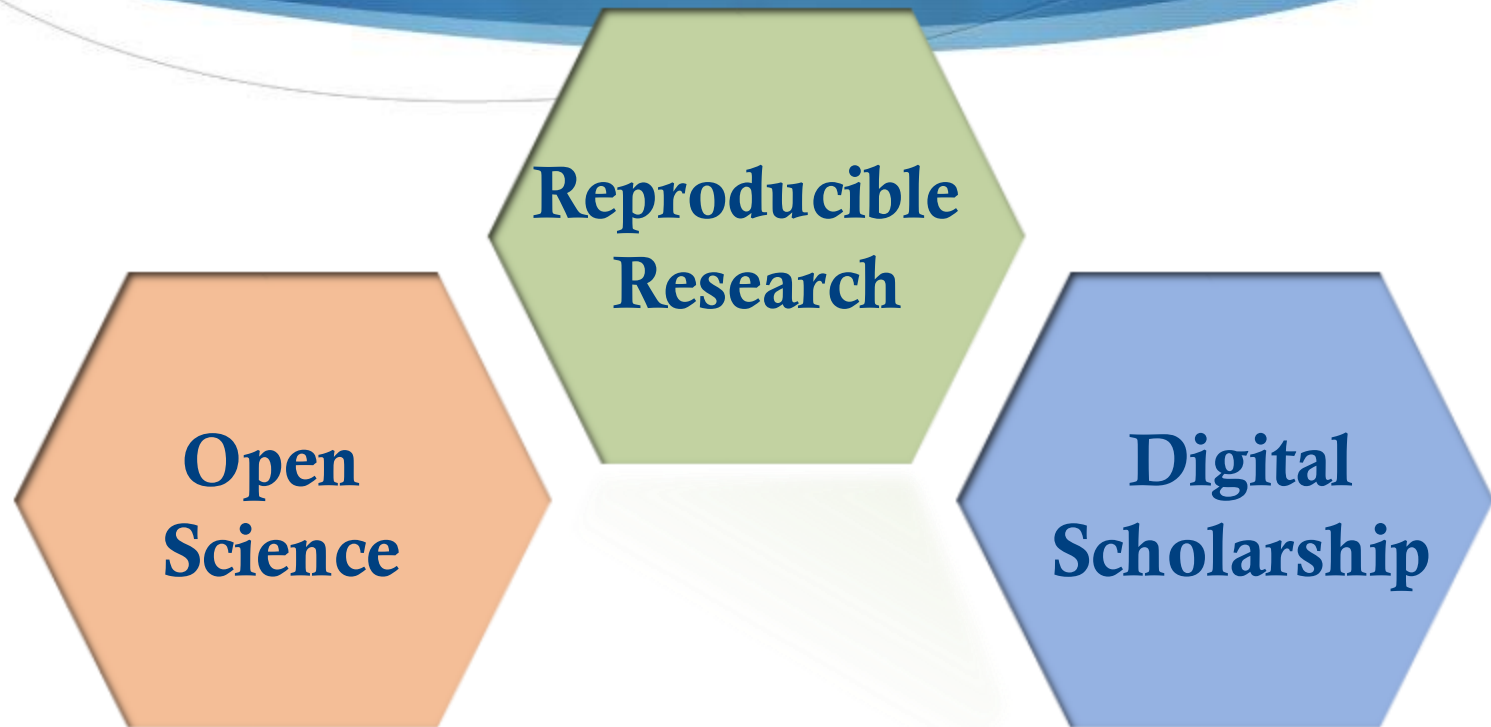

G20 Leaders' Communique Hangzhou Summit

Hangzhou, 5 September 2016

“We support appropriate efforts to promote open science and facilitate appropriate access to publicly funded research results on findable, accessible, interoperable and reusable (FAIR) principles.”

The Scientific Paper of the Future has further requirements

# What is a Scientific Paper of the Future

- **Data:** Available in a public repository, including documentation (metadata), a clear license specifying conditions of use, and citable using a unique and persistent identifier.
- **Software:** Available in a public repository, with documentation (metadata), a license for reuse, and citable using a unique persistent identifier.
  - Not only major software used, but also other ancillary software for data reformatting, data conversions, data filtering, and data visualization.
- **Provenance:** Documented for all results by explicitly describing the series of computations and their outcome with a provenance record of the execution traces and a workflow sketch (or formal workflow)
  - Possibly in a shared repository and with a unique and persistent identifier.

# Problems with Current Practice

- ★ Data is often not made available in publications
- ★ Limited reproducibility

*Nature Genetics* **41**, 149 - 155 (2009)

Published online: 28 January 2008 | doi:10.1038/ng.295

## Repeatability of published microarray gene expression analyses

scientists. Here we evaluated the replication of data analyses in 18 articles on microarray-based gene expression profiling published in *Nature Genetics* in 2005–2006. One table or figure from each article was independently evaluated by two teams of analysts. We reproduced two analyses in principle and six partially or with some discrepancies; ten could not be reproduced. The main reason for failure to reproduce was data unavailability, and discrepancies were mostly due to incomplete data annotation or specification of data processing and analysis.

RESEARCH ARTICLE

## Scholarly Context Not Found: One in Five Articles Suffers from Reference Rot

Martin Klein<sup>1\*</sup>, Herbert Van de Sompel<sup>1</sup>, Robert Sanderson<sup>1</sup>, Harihar Shankar<sup>1</sup>, Lyudmila Balakireva<sup>1</sup>, Ke Zhou<sup>2</sup>, Richard Tobin<sup>2</sup>

We analyze a vast collection of articles from three corpora that span publication years 1997 to 2012. For over one million references to web resources extracted from over 3.5 million articles, we observe that the fraction of articles containing references to web resources is growing steadily over time. We find one out of five STM articles suffering from reference rot, meaning it is impossible to revisit the web context that surrounds them some time after their publication. When only considering STM articles that contain references to web resources, this fraction increases to seven out of ten.

### Monitoring records of plant species in the Hakone region of Fuji-Hakone-Izu National Park, Japan, 2001–2010

Takeshi Osawa

## Abstract

The monitoring of species occurrences is a crucial aspect of biodiversity conservation, and regional volunteerism can serve as a powerful tool in such endeavors. The Fuji-Hakone-Izu National Park in the Hakone region of Kanagawa Prefecture, Japan, boasts a volunteer association of approximately 100 members. These volunteers have monitored plant species occurrences from 2001 to the present along several hiking trails in the region. In this paper, I present the annual observation records of plant occurrences in Hakone from 2001 to 2010. This data set includes 1,071 species of plants from 151 families. Scientific names follow the Y List, and this data set includes several threatened plant species. Data files are formatted based on the Darwin Core and Darwin Core Archives, which are defined by the Biodiversity Information Standards (BIS) or Biodiversity Information Standards Taxonomic Databases Working Group (TDWG). Data files filled on required and some additional item on Darwin Core. The data set can download from the author's personal Web site as of July 2012. These data will soon be published for the Global Biodiversity Information Facility (GBIF) through GBIF Japan. All users can then access the data from the GBIF portal site.

• The complete data set for this abstract published in the Data Paper section of the journal is available in electronic format in Ecological Research Data Paper Archives at [http://db.cger.nies.go.jp/JaLTER/ER\\_DataPapers/archives/2013/ERDP-2013-01](http://db.cger.nies.go.jp/JaLTER/ER_DataPapers/archives/2013/ERDP-2013-01).

## ★ Data published in a repository

LTER Identifier:

knb-lter-ntl.279.1

Abstract:

These data were collected by the Wisconsin Department of Natural Resources (WDNR) from 1987-1998. Most of these data (1987-1993) precede 1995, the year that the University of Wisconsin's NTL-LTER program took over sampling of the Yahara Lakes. However, WDNR data collected from 1997-1998 (unrelated to LTER sampling) is also included. In 1987 a joint project by the WDNR and the University of Wisconsin-Madison, Center for Limnology (CFL) was initiated on Lake Mendota. The project involved biomonitoring o...

# “Dark Data”

## Shedding Light on the Dark Data in the Long Tail of Science

P. Bryan Heidorn

---

**From:** Library Trends

Volume 57, Number 2, Fall 2008

pp. 280-299 | 10.1353/lib.0.0036

---

### Abstract:

One of the primary outputs of the scientific enterprise is data, but many institutions such as libraries that are charged with preserving and disseminating scholarly output have largely ignored this form of documentation of scholarly activity. This paper focuses on a particularly troublesome class of data, termed *dark data*. “Dark data” is not carefully indexed and stored so it becomes nearly invisible to scientists and other potential users and therefore is more likely to remain underutilized and eventually lost. The article discusses how the concepts from long-tail economics can be used to understand potential solutions for better curation of this data. The paper describes why this data is critical to scientific progress, some of the properties of this data, as well as some social and technical barriers to proper management of this class of data. Many potentially useful institutional, social, and technical solutions are under development and are introduced in the last sections of the paper, but these solutions are largely unproven and require additional research and development.

## Recommended: CC-BY and CC0

### Attribution CC BY

This license lets others distribute, remix, tweak, and build upon your work, even commercially, as long as they credit you for the original creation. This is the most accommodating of licenses offered. Recommended for maximum dissemination and use of licensed materials.

### CC0 (datasets) “No rights reserved”

CC0 can be particularly important for the sharing of data and databases, since it otherwise may be unclear whether highly factual data and databases are restricted by copyright or other rights. Databases may contain facts that, in and of themselves, are not protected by copyright law.

CC0 is recommended for data and databases and is used by hundreds of organizations. It is especially recommended for scientific data. Although CC0 doesn't legally require users of the data to cite the source, it does not take away the moral responsibility to give attribution, as is common in scientific research.

# Main Types of Unique Identifiers

1. Uniform Resource Locator (URL)
2. Persistent URL (PURL)
3. Digital Object Identifier

# URL/URI

- Minimal effort to create
- No guarantee of persistence
  - i.e., almost guaranteed it will not have persistence
  - e.g.,  
`http://www.greatuniversity.edu/gradstudents/joesmith/awesome data/`

**Do not use in papers!!**

# Persistent URL (PURL)

- The same PURL can be resolved to different Web address over time
  - Go to <https://w3id.org>, or other PURL services
    - Create a PURL, and direct it to where you have the data today e.g.:  
<http://www.wisc.edu/myadvisorsgroup/awesomedata.html>
  - Always refer to your data with the same PURL:  
<http://w3id.org/mydataandme/awesomedata.html>
    - Tomorrow you have graduated and tell w3id.org to resolve your PURL to:  
<http://www.stanford.edu/myowngroup/awesomedata.html>
- It is easy to create your own PURLs, just remember to update whenever you move the data

# Digital Object Identifier (DOI)

PLoS Biol. 2003 Nov; 1(2): e57.

Published online 2003 Nov 15 doi: [10.1371/journal.pbio.0000057](https://doi.org/10.1371/journal.pbio.0000057)

DOIs can only be issued by a DOI authority (eg a journal publisher) that guarantees to always resolve it

## The What and Whys of DOIs

[Susanne DeRisi](#), [Rebecca Kennison](#), and [Nick Twyman](#)

[Copyright and License information ►](#)

Data repositories can issue DOIs for data

This article has been [cited by](#) other articles in PMC.

DOIs are free

As you may have noticed in the first issue of *PLoS Biology* and again in this issue, there are many places where an alphanumeric string appears after the letters “DOI,” such as [10.1371/journal.pbio.0000005](https://doi.org/10.1371/journal.pbio.0000005) or [10.1371/journal.pbio.0000005.g005](https://doi.org/10.1371/journal.pbio.0000005.g005). Although some of you may already be acquainted with DOIs, others of you may wonder what they are, how they are used, and why we are using them.

## What Are DOIs?

Go to: ☐

A Digital Object Identifier (DOI) is an URN (Uniform Resource Name), a compact string that provides a unique, persistent, and actionable identifier for the digital object with which it is associated. DOIs are commonly assigned to scientific articles in their electronic form, but DOIs may also be used as identifiers for any object in any location, although this usage is not yet common outside the online world. The International DOI Foundation (IDF), which governs the DOI system, has several hundred registrant organizations and in August 2003 reported that over 10 million DOIs have been issued since the foundation was created in 1998 (<http://www.doi.org/news/03augnews.html>).

# Best Practices (5 of 5)

## Highly connected drug file

|                    |     |    |                                                   |

OPEN  ACCESS Freely available online

## Sharing Detailed Research Data Is Associated with Increased Citation Rate

Heather A. Piwowar\*, Roger S. Day, Douglas B. Fridsma

Department of Biomedical Informatics, University of Pittsburgh School of Medicine, Pittsburgh, Pennsylvania, United States of America

**Background.** Sharing research data provides benefit to the general scientific community, but the benefit is less obvious for the investigator who makes his or her data available. **Principal Findings.** We examined the citation history of 85 cancer microarray clinical trial publications with respect to the availability of their data. The 48% of trials with publicly available microarray data received 85% of the aggregate citations. Publicly available data was significantly ( $p = 0.006$ ) associated with a 69% increase in citations, independently of journal impact factor, date of publication, and author country of origin using linear regression. **Significance.** This correlation between publicly available data and increased literature impact may further motivate investigators to share their detailed research data.

# Data Citation Format

0

Embed\*

Data repositories and journals often specify how to cite data

# What if...

- **... there are several datasets in several files?**
  - Create a DOI for each file and a DOI for the whole set
- **... the data is from a public repository?**
  - Publish the query, create a DOI + metadata for it, mention the original source in the metadata, point to the original data source
- **... the data is from a colleague?**
  - Get permission in advance and make an agreement, then do as with the data from a public repository

- **... the data comes from many sources?**
  - Credit each source, create URIs as needed
  - Can create a table with “microattributions” that summarize each data source
- **... the data comes from a database?**
  - Create a file (or files) from it
- **... the data has many versions?**
  - Create a DOI either for each slice or for each snapshot

# Goals of this Section

1. Understand what those best practices mean
2. Understand how to implement those best practices

# Making Data Accessible: Simplest Approach

- 1. Create a public entry for your dataset with a persistent unique identifier**
    - Go to a domain repository (use a general repository, e.g., zenodo.org, if you cannot find one), create an account
    - Create an entry for your dataset
  - 2. Specify the metadata**
    - Including license -- choose from <http://www.creativecommons.org/licenses>
  - 3. Upload/point to the data**
- Voilà! The repository will give you a data citation**

# Making Data Accessible: Ideal Approach

1. Find a repository that your community uses, if there is not one then organize one!
2. Create a public entry for your dataset with a persistent unique identifier
  - Create an entry for your dataset
3. Specify the metadata
  - Including license -- choose from <http://www.creativecommons.org/licenses>
4. Upload/point to the data
5. Get a data citation from the repository

Making Data Accessible:

# Cite the data in your paper

**Initial  
raw  
data**

**Intermediate  
data**

**Final  
data**

- Citation goes in the References section
- How to cite the data? You choose:
  - With an in-text pointer as you would cite any other paper (recommended)
  - With an in-text pointer in a special “Data Resources” section
  - With an in-text pointer in the “Acknowledgments” section

# Scientific Paper of the Future Training

# The Value of Software

## Availability of Software

PLOS supports the development of open source software and believes that, for submissions appropriate open source standards will ensure that the submission conforms to (1) our requirement that another researcher can reproduce the experiments described, (2) our aim to promote openness so that PLOS journals can be built upon by future researchers. Therefore, if new software or a new application that the software conforms to the [Open Source Definition](#), have deposited the following three items with your submission as Supporting Information:

- **The associated source code of the software described by the paper.** This should be licensed under a suitable license such as BSD, LGPL, or MIT (see <http://www.opensource.org/licenses/>). The use of commercial software such as Mathematica and MATLAB does not preclude a paper from being open source preferred.
- **Documentation for running and installing the software.** For end-user applications, a README file is a prerequisite; for software libraries, instructions for using the application program interface (API) are required.
- **A test dataset with associated control parameter settings.** Where feasible, results should be reproducible. Test data should not have any dependencies — for example, a database dump.

Acceptable archives should provide a public repository of the described software. The code should be available for creating user accounts, logging in or otherwise registering personal details. The repository should contain more than 1,000 projects. Examples of such archives are: [SourceForge](#), [Bioinformatics.Org](#), [Savannah](#), [GitHub](#) and the [Codehaus](#). Authors should provide a direct link to the deposited software.

# Software Papers and Software Repositories

- Some journal articles describe a piece of software
- Some publications have “software papers” or “software metapapers”

Apache Open Climate Workbench

# Why Is Scientific Software Not Shared?

- “No one would use my code if I shared it”
- “My code is really bad”
- “My code is not ready to be shared”
- “Sharing my software will take a lot of time”
- “I won’t get anything out of sharing my software”
- “I’ve shared software before, bad things happened”
- “I work for the government”
- “I want to commercialize my software”
- “I don’t want anyone to commercialize my software”
- “I don’t know where to start!”

# Data Preparation Software Dominates but is Least Shared

- “Scientists and engineers spend more than 60% of their time just preparing the data for model input or data-model comparison” (NASA A40)

*“Common Motifs in Scientific Workflows: An Empirical Analysis.” Garijo, D.; Alper, P.; Belhajjame, K.; Corcho, O.; Gil, Y.; and Goble, C. Future Generation Computer Systems, 2013.*

# “Dark Software”

- Models that are not published
  - E.g. from a PhD thesis
- Data preparation software
- Visualization software

“Dark Software” is the counterpart of “Dark Data” [Heidorn 2008]

DON'T WORRY,  
YOU DON'T HAVE  
TO START YOUR  
CODE FROM  
SCRATCH.

YOU CAN RE-USE THE  
SOFTWARE THAT THE  
PREVIOUS PERSON  
ON THE PROJECT  
WROTE SEVERAL  
YEARS AGO.

ARE THERE  
INSTRUCTIONS FOR  
HOW TO USE IT?

I DOUBT IT.

IS THE CODE  
COMMENTED?

NOT LIKELY.

WHERE ARE  
THE FILES?

WHO KNOWS.

THIS IS GOING  
TO BE PAINFUL,  
ISN'T IT?

JUST A  
SCRATCH.

# Goals of this Section

1. Making software ready for publication
2. Understand best practices in software publication
3. Understand how to implement those best practices

# Some Notes on Making Software Ready for Publication

- ① Source code vs executable
- ② Making software run elsewhere
- ③ Making software modular
- ④ Making software configurable
- ⑤ Making software report errors
- ⑥ Providing test data
- ⑦ Code analysis

# Goals of this Section

1. Making software ready for publication
2. Understand best practices in software publication
3. Understand how to implement those best practices

# Best Practices

1. Accessible from a public location
2. License
3. Citation

# Making Software Accessible from a Public Location

**PURL**

zenodo

 **GitHub**

 **The Apache  
Software Foundation**  
Community-led development since 1999.

## Options:

- **Publish in your web site**
  - Very easy and simple
  - Get a PURL for the version you use in the paper
- **Use a data repository** (e.g., Zenodo), treating code like data
  - Very easy and simple
  - It allows you to get a DOI
- **Use a code repository** (e.g., GitHub, BitBucket)
  - Beneficial if you have other users or want to track new versions
  - Some will give you a DOI (e.g., GitHub)
- **Create a formal community project** (e.g., in Apache)
  - Very involved, but very beneficial if you have many users

# Choosing an Open Source License

- Copyright: automatically applied to software when it is created to grant *the creator* exclusive rights as an intellectual property
- **Open source license:** reduce constraints and enable software developers to make their source code available to public
  - “Copyleft” license (ex: GNU General Public License (GPL))
  - “Permissive” license (ex: Apache 2 or MIT licenses)
- **Open Source Initiative**
  - Choose a license from: <http://opensource.org/licenses>
  - Recommend that you choose a permissive license
    - Apache v2

# Some repositories can help you choose a license

**kgtk**

# Software Citation

- What do you want to cite?
  - Code? Project Website? Commit? Release?
- Use a persistent unique identifier (PURL or DOI)
  - Analogous to identifiers for data
- Software sharing repositories are beginning to offer the ability to assign DOIs

**More information: Smith AM, Katz DS, Niemeyer KE, FORCE11 Software Citation Working Group. (2016) Software Citation Principles. *PeerJ Computer Science* 2:e86. DOI: [10.7717/peerj-cs.86](https://doi.org/10.7717/peerj-cs.86)**

# Software Citation Format

- Similar to data citation format, but includes software version

# Goals of this Section

1. Making software ready for publication
2. Understand best practices in software publication
3. Understand how to implement those best practices

```
function enEdition(){
 /* Ne rien faire mode edit +
 if(encodeURIComponent(document.
 turn;
 // /&preload=/

 if (!wgPageName.match(/Discussion
 var diff = new Array();
 var status; var pecTraduction; var p
 var avancementTraduction; var avance

 /* ***** Parser ***** */
 var params = document.location.search
 gth).split('&');
 var i = 0;
 var tmp; var name;
 while (i < params.length)
 {
 tmp = params[i].split('=');
 name = tmp[0];
 switch(name) {
 case 'status':
 status = tmp[1];
 break;
 }
 }
}
```

# Making Software Accessible: Simplest Approach

1. Create a public entry for your software with a persistent unique identifier
  - Upload to a data repository (e.g., Zenodo) as you would data, and get a DOI
  - Or post on your web site and use a PURL
2. Specify basic metadata
  - Including license -- choose from <http://opensource.org/licenses>, preferably Apache v2.0
3. Specify desired citation

Making Software  
Accessible:

# Ideal Approach

```
function enEdition(){
 /* Ne rien faire mode edit +
 if(encodeURIComponent(document.
 turn;
 // /&preload=/

 if (!wgPageName.match(/Discussion
 var diff = new Array();
 var status; var pecTraduction; var p
 var avancementTraduction; var avance

 /* ***** Parser ***** */
 var params = document.location.search
 gth).split('&');
 var i = 0;
 var tmp; var name;
 while (i < params.length)
 {
 tmp = params[i].split('=');
 name = tmp[0];
 switch(name) {
 case 'status':
 status = tmp[1];
 break;
 }
 }
}
```

1. Learn to use a code repository that allows version tracking and collaborative software development
  - GitHub, BitBucket, etc.
2. Create a public entry for your software with a persistent unique identifier
3. Specify the metadata
  - Including license -- choose from <http://opensource.org/licenses>, preferably Apache v2.0
4. Specify desired citation

Making Software  
Accessible:

# Cite the software in your paper

Analogous to citing data:

- Citation goes in the References section
- How to cite the software?  
You choose:
  - With an in-text pointer as you would cite any other paper (recommended)
  - With an in-text pointer in a special “Data Resources” (or “Software Resources”) section
  - With an in-text pointer in the “Acknowledgments” section

# Scientific Paper of the Future Training

## Part I

1. Motivation and overview: open science, reproducible publications, and digital scholarship
2. Making data accessible
3. Making software accessible
4. *PRACTICAL EXERCISE*
5. Documenting software with metadata

## Part II

1. Documenting software dependencies
2. Documenting methods and workflows
3. Documenting provenance
4. *PRACTICAL EXERCISE*
5. Summary of author checklist

# Practical Exercise: Obtain a DOI for your software (1)

- Use your GitHub credentials to log into **Zenodo** (<https://zenodo.org>)
- **Authorize** Zenodo to access your GitHub account
- In **settings** -> GitHub, your repository should appear accessible
- Flip the switch to “**ON**”
- More details at <https://guides.github.com/activities/citable-code/>

# Practical Exercise: Obtain a DOI for your software (2)

- Add code to your GitHub repository. When you are ready, click on “releases” and select “Create new release”.
- Describe your release
- Give it a proper **version number**! **Semantic versioning:** <https://semver.org/>
- Now go to your Zenodo page. If everything went correctly, you should see a DOI for your GitHub repository
- Now you can copy the blue Zenodo badge with the DOI back in your GitHub readme file

# Software Repositories

You have published  
your software in a  
repository...

Is that sufficient for  
others to reuse it?

# Software Repository vs Software Registry

- **Software repository**

- Code resides there
- Support software evolution
- Support groups of developers of open source software

- **Software registry**

- Capture metadata
  - Useful structured information about the code

# Goals of this Section

1. Understand what metadata needs to be documented about software to promote reuse
2. Understand how to use a software registry to specify that metadata

# Software Metadata

- Describe characteristics of the software that others can understand, discover (find), and compare software
- Six major categories of software metadata
  - Developed as part of the OntoSoft project
    - <http://www.ontosoft.org/software>

# A vocabulary for describing software: Codemeta

| Property             | Type               | Description                                                                                                                  |
|----------------------|--------------------|------------------------------------------------------------------------------------------------------------------------------|
| softwareSuggestions  | SoftwareSourceCode | Optional dependencies , e.g. for optional features, code development, etc.                                                   |
| maintainer           | Person             | Individual responsible for maintaining the software (usually includes an email contact address)                              |
| contIntegration      | URL                | link to continuous integration service                                                                                       |
| buildInstructions    | URL                | link to installation instructions/documentation                                                                              |
| developmentStatus    | Text               | Description of development status, e.g. Active, inactive, suspended. See <a href="https://repostatus.org">repostatus.org</a> |
| embargoDate          | Date               | Software may be embargoed from public access until a specified date (e.g. pending publication, 1 year from publication)      |
| funding              | Text               | Funding source (e.g. specific grant)                                                                                         |
| issueTracker         | URL                | link to software bug reporting or issue tracking system                                                                      |
| referencePublication | ScholarlyArticle   | An academic publication related to the software.                                                                             |

- Schema.org extension (findable by search engines)

# Finding Software

- Any kind of software metadata can be useful to find software
  - “I want R code...”
  - “I want to see software by John Smith...”
  - “I want software that is well supported...”
  - “I want software that simulates water runoff...”
  - “I want software that uses elevation data...”

# What if...

- **... there are many versions of the software?**

- Give unique identifiers to the most significant versions that you want to release
- Relate those versions to one another

- **... the software is already in a public repository?**

- Create a proper documentation and description of the software

- **... the software is relatively small?**

- If you think it may be useful to someone (think of people who do not program!), then release it

- **... the software is a large package with many functions?**

- Consider releasing the large package as a whole for those who want all the functionality
- Consider also releasing pieces of it with limited functionality that may have a broader audience

# Goals of this Section

1. Understand what needs to be documented about software to promote reuse
2. Understand how to use a software registry to specify that metadata

# Describing Software with OntoSoft

<http://www.ontosoft.org/portal>

The screenshot shows the OntoSoft web interface. At the top, there is a navigation bar with links for 'Software', 'Community', and 'Training'. Below this, the breadcrumb trail reads 'PIHM » Identify » LOCATE'. The main content area is divided into two sections: 'Important' and 'Optional'. The 'Important' section contains three questions: 'What is the software called?', 'What is a short description for this software?', and 'What are general categories (keywords, labels) for this software?'. The 'Optional' section contains one question: 'Is there a project website for the software?'. The 'What is the software called?' question has a text input field with 'PIHM' entered. The 'What is a short description for this software?' question has a text area with a description of PIHM. The 'What are general categories (keywords, labels) for this software?' question has a list of categories: 'Hydrology', 'Basins', and 'Continental'. The 'Is there a project website for the software?' question has a text input field with 'http://www.pihm.psu.edu/pihm\_home.html' entered. On the left side of the interface, there is a circular diagram with six segments labeled 'Identify', 'Understand', 'Execute', 'Do Research', 'Get Support', and 'Update'. Below the diagram is a button labeled 'Locate unique description'.

OntoSoft Software Community Training

PIHM » Identify » **LOCATE**

Identify Understand Execute Do Research Get Support Update

Locate unique description

Important Optional

What is the software called ?

PIHM

What is a short description for this software ?

PIHM is a multiprocess, multi-scale hydrologic model where the major hydrological processes are fully coupled using the semi-discrete finite volume method. PIHM is a physical model for surface and groundwater, "tightly-coupled" to a GIS interface. PIHMgis which is open source, platform independent and extensible. The tight coupling between GIS and the model is achieved by developing a shared data-model and hydrologic-model data structure.

Initial metadata was retrieved from  
<http://csdms.colorado.edu/wiki/Model:PIHM>

What are general categories (keywords, labels) for this software ?

Hydrology

Basins

Continental

Is there a project website for the software ?

[http://www.pihm.psu.edu/pihm\\_home.html](http://www.pihm.psu.edu/pihm_home.html)

Questions for 6 top categories, some "important" and some "optional"

Automatic crawlers import metadata from code repositories (eg GitHub)

# Documenting Software through Metadata:

# Simplest Approach

1. Describe as much metadata as you can in your software site
  1. Document the basic metadata discussed earlier
  2. If you use a code repository, there is some basic structure you can follow

# Ideal Approach

1. Use a software registry
  - <http://www.ontosoft.org/portal>, [csdms.colorado.edu](http://csdms.colorado.edu), etc.
2. Save the metadata as HTML, XML, ...
  - Use codemeta generator to create a Codemeta file
3. Post the metadata on your code site

Website for the software ?  
[www.pihm.psu.edu/pihm\\_home.html](http://www.pihm.psu.edu/pihm_home.html)

[OPTIONAL] What is the DOI or any other unique identifier for this software (or software version) ?

---

### Understand

---

**Trust** - Quality and ratings

Who created this software? (Project, Organization, Person, Initiative, etc.)

- Christopher Duffy

Are there any additional contributors of note for this software ?

- Akesh Kumar
- Bhatt

Features of this software are worth highlighting ?

Is this software of this software if not the author ?

# Scientific Paper of the Future Training

# Software dependency hell

**“Oh, you can’t run my code? But it works in my machine...”**

- Package dependencies may have incompatibilities
  - E.g., some dependencies may work in Python 3.6 but do not in Python 3.7...
- Some libraries may require different versions installed
  - In one project, library A requires numpy=1.0, but in my laptop I installed numpy 2.0 for project B
- Different operative systems may support different libraries

# How to keep track of your software dependencies?

## Virtual environments

```
PS C:\Users\dgarijo\Documents\GitHub\SM2KG> .\env\Scripts\activate
(env) PS C:\Users\dgarijo\Documents\GitHub\SM2KG> python --version
Python 3.7.7
(env) PS C:\Users\dgarijo\Documents\GitHub\SM2KG> deactivate
PS C:\Users\dgarijo\Documents\GitHub\SM2KG> python --version
Program 'python' failed to run: No application is associated with the
+ python --version
```

## Containers

## Package managers

## Virtual machines

# Software Containers

- Track the software dependencies and OS
- Software image: executable which specifies a full
  - computational environment
  - code, runtime, system tools, system libraries and settings
- Container: virtualized computational environment
- Used to run one or multiple software images

<https://www.docker.com/resources/what-container>

# Documenting Software dependencies: Simplest Approach

1. Keep track of your dependencies
  1. Describe precisely the requirements in your readme
  2. Preserve your environment (requirements.txt., pom.xml, etc.)

# Ideal Approach

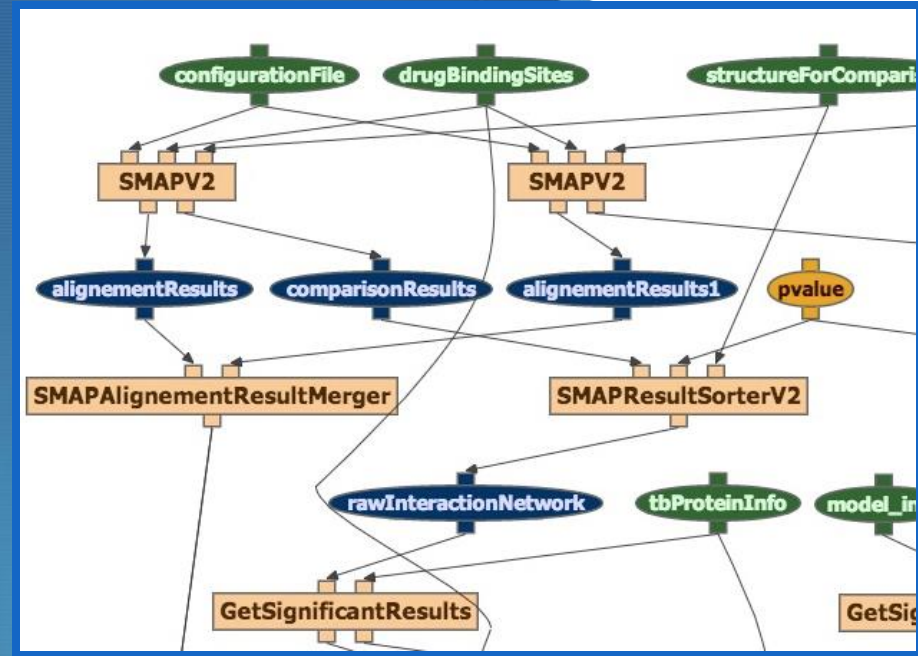

1. **Generate one or multiple DockerFiles**
  - E.g., develop version, main version, etc.
2. **Make image available in an image repository**
  - E.g., DockerHub (there are others)
3. **Describe your image with basic metadata**

# Methods and Workflows in the Scientific Paper of the Future

5. Documenting software with metadata

## Part II

1. Documenting software dependencies
2. Documenting methods and workflows
3. Documenting provenance
4. *PRACTICAL EXERCISE*
5. Summary of author checklist

# Methods Described in Text Are Ambiguous and Incomplete

- “**Ambiguity** in program descriptions leads to the possibility, if not the certainty, that a given natural language description can be converted into computer code in various ways, each of which may lead to different numerical outcomes.” [Ince et al 2012]
- Analysis of 18 quantitative papers published in Nature Genetics in the past two years found that reproducibility was not achievable even in principle in 10 cases, even when datasets are published [Ioannidis et al 09]
- “Data processing, however, is often not described well enough to allow for exact reproduction of the results, leading to exercises in ‘**forensic bioinformatics**’ where aspects of raw data and reported results are used to infer what methods must have been employed.” [Baggerly and Coombes 09]

# Goals of this Section

1. Understand what are methods and provenance is in a scientific article
2. Understand how to document methods and provenance properly in an article

# Programs as Black Boxes: Functions with Inputs, Outputs, and Parameters

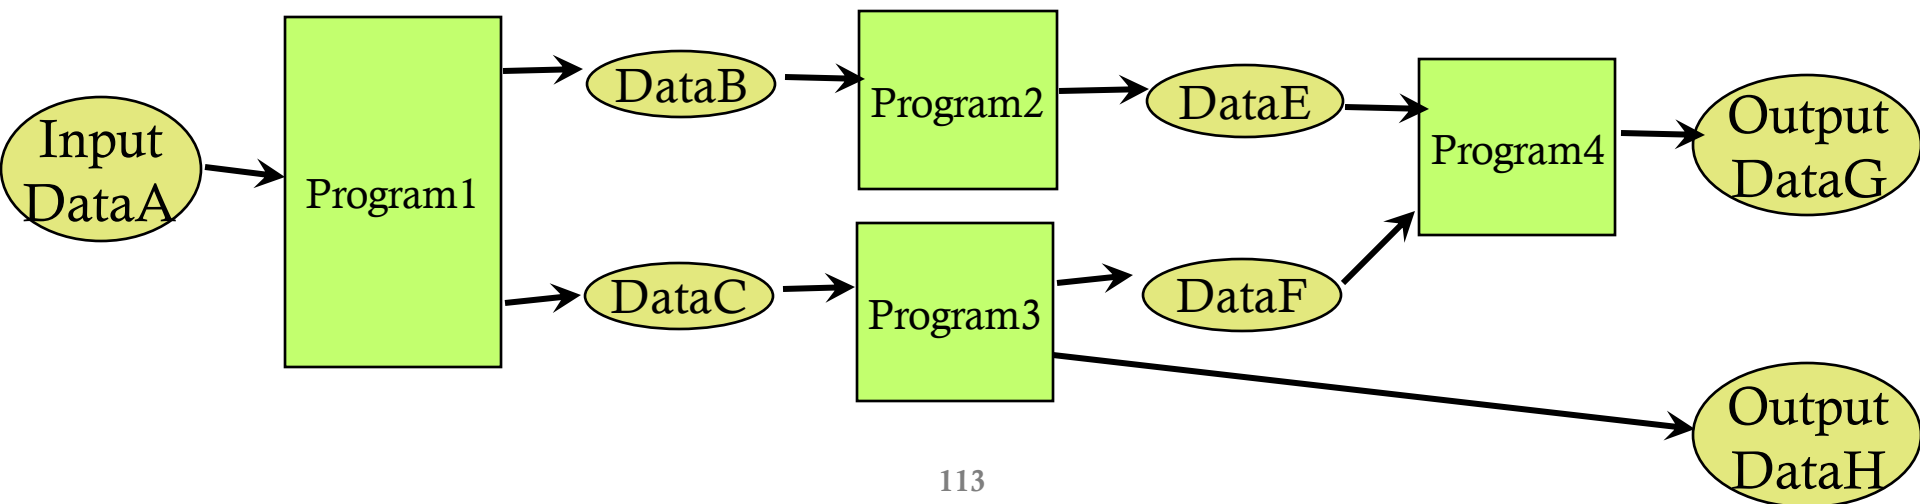

# Composing Functions

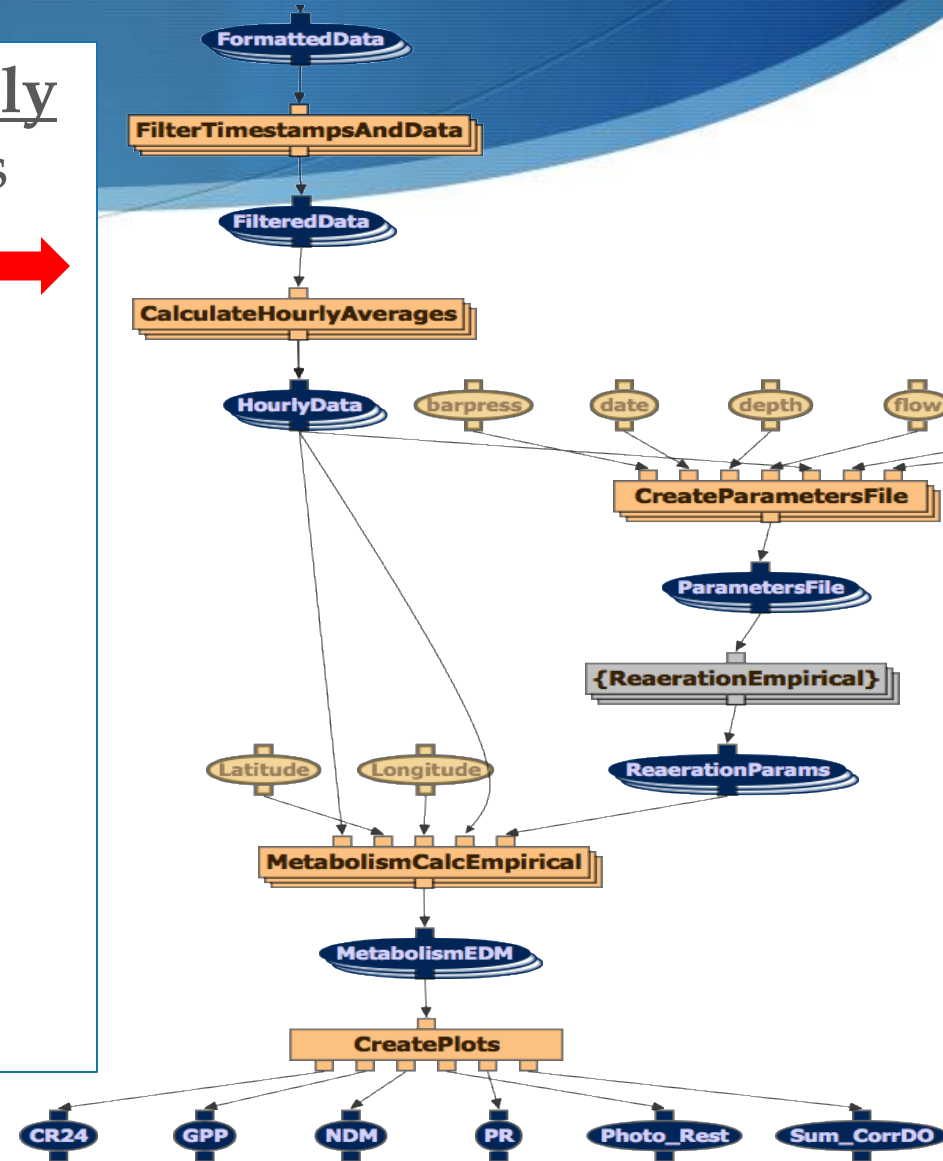

# Computational Workflows

- Workflow is represented as a graph of connected nodes
  - Nodes represent programs and data (alternatively)
  - Links represent how data flows from program to program (output to input)
- Computational workflows are compositions of programs
  - No user interaction during execution
  - No cycles allowed!

# Workflows as Representations of Computational Methods

- **Computational workflow** only contains computational steps
  - E.g., water metabolism →
- Workflows can include manual steps
  - E.g., creating a figure, cleaning data
- Workflows may access web services
  - E.g., access databases in biology

## Stratovolcano

From Wikipedia, the free encyclopedia

A **stratovolcano**, also known as a **composite volcano**,<sup>[1]</sup> is a conical volcano built up by many layers (strata) of hardened lava, tephra, pumice, and volcanic ash. Unlike shield volcanoes, stratovolcanoes are characterized by a steep profile and periodic explosive eruptions and effusive eruptions, although some have collapsed craters called calderas. The lava flowing from stratovolcanoes typically cools and hardens before spreading far due to high viscosity. The magma forming this lava is often felsic, having high-to-intermediate levels of silica (as in rhyolite, dacite, or andesite), with lesser amounts of less-viscous mafic magma. Extensive felsic lava flows are uncommon, but have travelled as far as 15 km (9.3 mi).<sup>[2]</sup>

Stratovolcanoes are sometimes called "composite volcanoes" because of their composite layered structure built up from sequential outpourings of eruptive materials. They are among the most common types of volcanoes, in contrast to the less common shield volcanoes. Two famous stratovolcanoes are Krakatoa, best known for its catastrophic eruption in 1883 and Vesuvius, famous for its destruction of the towns Pompeii and Herculaneum in 79 AD. Both eruptions claimed thousands of lives.

Existence of stratovolcanoes has not been proved on other terrestrial bodies of solar system<sup>[3]</sup> with one exception. Their existence was suggested for some isolated massifs on Mars, e.g., Zephyria Tholus.<sup>[4]</sup>

# A Working Definition of Provenance

Provenance of a resource is **a record** that describes entities and processes involved in producing and delivering or otherwise influencing that resource.

Provenance provides a critical foundation for assessing authenticity, enabling trust, and allowing reproducibility.

- Provenance results from **past** actions
- Provenance can be seen as **metadata**, but not all metadata is provenance

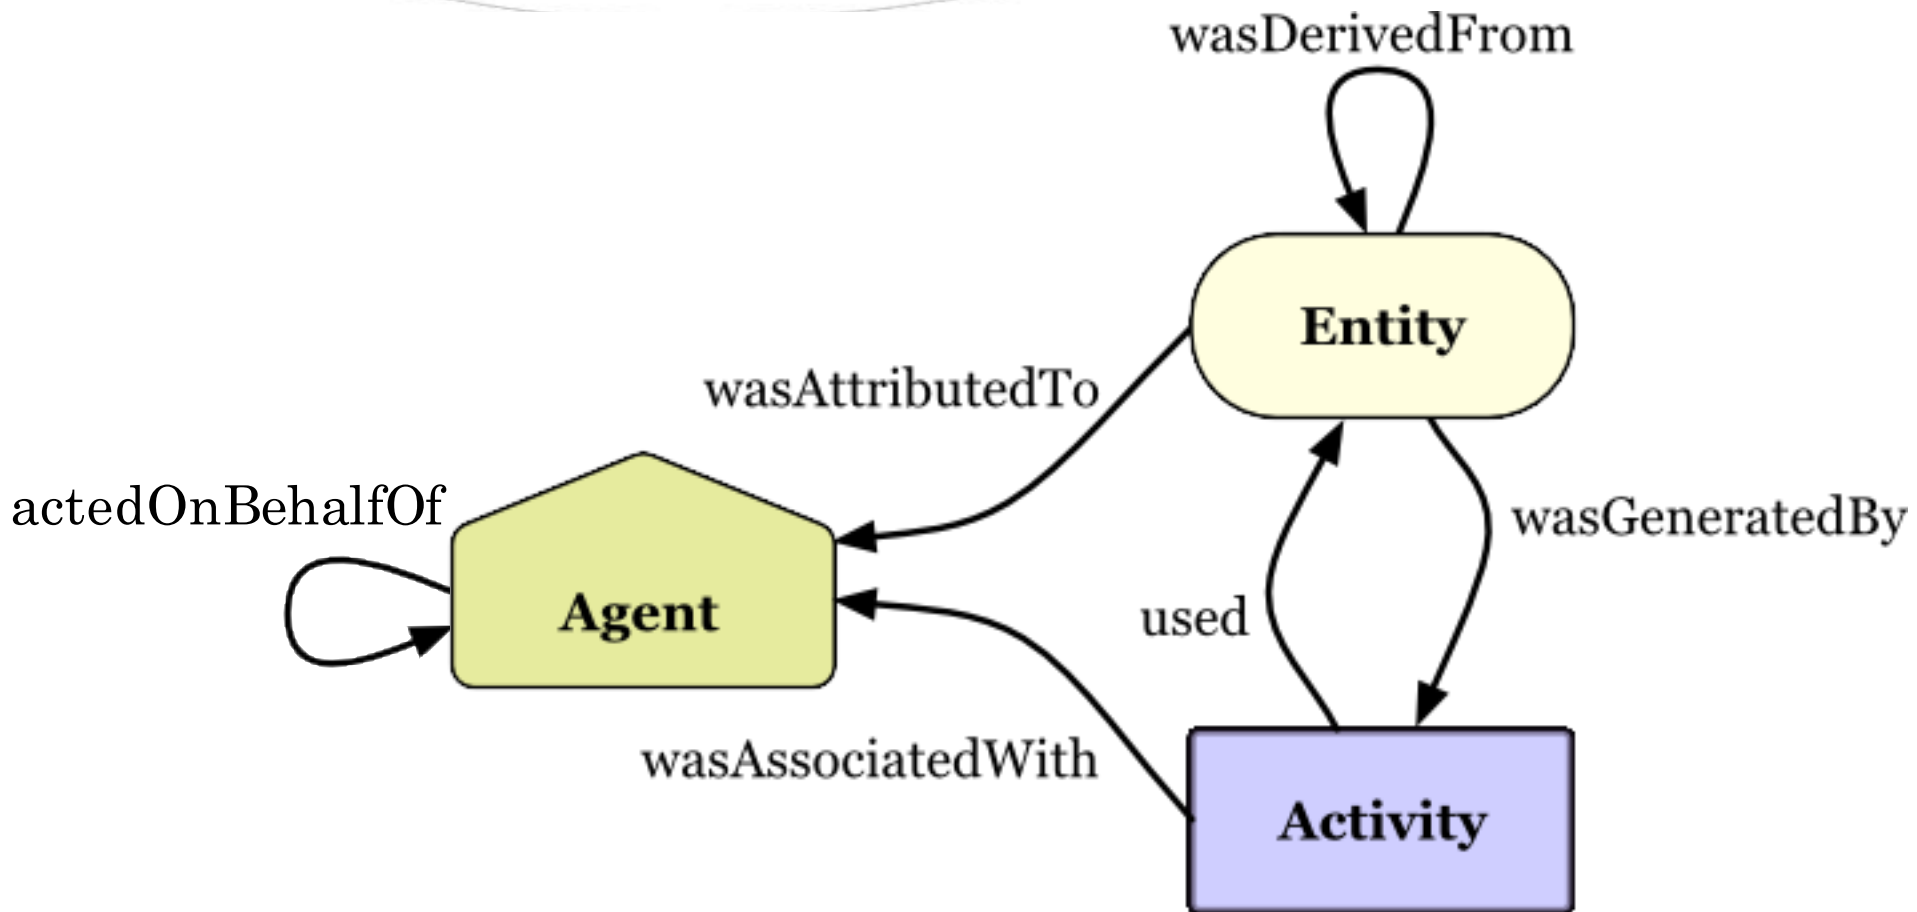

# A Well-Known Provenance Vocabulary: The Dublin Core

# Publishing Provenance and Workflows

- Hard to deposit workflows or provenance in a repository
  - Not many repositories available
  - Not many communities sharing repositories
  - This will change in the near future
- Publish workflow and/or provenance in a data repository, get a persistent identifier, and cite

# An Example

## Understanding kinematic data from the Hellerman thrust zone

Jade Silverstein

[...] We took a quartzite sample from the Hellerman thrust zone, and cut 3 thin sections. We measured c-axis orientations using a petrographic microscope. We rotated to a common reference frame using Duyster's StereoNett program. We plotted the data on lower hemisphere, equal area projections using Duyster's StereoNett program, shown in Figure 4. [...]

# Goals of this Section

1. Understand what are methods and provenance is in a scientific article
2. Understand how to document methods and provenance properly in an article

# Documenting Provenance and Methods:

## Simplest Approach

1. Describe the workflow in text
  - Data + software + workflow
  - Specify unique identifiers for data and software, versions, credit all sources
2. Develop a workflow sketch
  - Capture high-level dataflow across components
3. For provenance, include a summary or an execution trace

# Documenting Provenance and Methods:

## Ideal Approach

1. Describe the workflow in text
  - Data + software + workflow
  - Specify unique identifiers for data and software, versions, credit all sources
2. Develop a workflow sketch
  - Capture high-level dataflow across components
3. Specify the formal workflow using a workflow system, electronic notebook, etc.
  - Command lines + parameter values
  - Dataflow across components
4. Include the provenance record
  - If generating it automatically, preferably using a standard (e.g., PROV)
5. Publish the workflow and provenance record in a publicly accessible repository (eg figshare, myExperiment, etc)
6. Get a unique persistent identifier for the workflow, the provenance, or both

1

2

3

## Documenting Provenance and Methods:

# How to show provenance and workflow in an article

- Describe the workflow in text
  - In the “Methods” section
- Include your workflow sketch
  - As a figure in the article
- Include your provenance summary or trace
- If available as formal workflow and provenance record, cite them in the paper (use a format analogous to data and software citation)

# Scientific Paper of the Future Training

## Part I

1. Motivation and overview: open science, reproducible publications, and digital scholarship
2. Making data accessible
3. Making software accessible
4. *PRACTICAL EXERCISE*
5. Documenting software with metadata

## Part II

1. Documenting software dependencies
2. Documenting methods and workflows
3. Documenting provenance
4. *PRACTICAL EXERCISE*
5. Summary of author checklist

# PRACTICAL EXERCISE:

## Representing Provenance

- Laura designs a survey about student financial support
- Jack and Jill conduct the survey and collect data
- A year later, Laura revises the survey
- Peter and Paula conduct the survey and collect data
- Zack compiles all the survey results, analyzes them with a statistics package, and publishes a paper with Laura and other co-authors

Sketch a diagram using PROV for:

1. Entities
2. Activities
3. Use and generation
4. Agents
5. Revision and derivation
6. Plans

# What is a Scientific Paper of the Future

- **Data:** Available in a public repository, including documentation (metadata), a clear license specifying conditions of use, and citable using a unique and persistent identifier.
- **Software:** Available in a public repository, with documentation (metadata), a license for reuse, and citable using a unique persistent identifier.
  - Not only major software used, but also other ancillary software for data reformatting, data conversions, data filtering, and data visualization.
- **Provenance:** Documented for all results by explicitly describing the series of computations and their outcome with a provenance record of the execution traces and a workflow sketch (or formal workflow)
  - Possibly in a shared repository and with a unique and persistent identifier.

# Scientific Paper of the Future

## Modern Paper

### Text:

Narrative of the method, some data is in tables, figures/plots, and the software used is mentioned

### Data:

Include data as supplementary materials and pointers to data repositories

## Reproducible Research

### Software:

For data preparation, data analysis, and visualization

### Provenance and methods:

Workflow/scripts specifying dataflow, codes, configuration files, parameter settings, and runtime dependencies

## Open Science

### Sharing:

Deposit data and software (and provenance/workflow) in publicly shared repositories

### Open licenses:

Open source licenses for data and software (and provenance/workflow)

### Metadata:

Structured descriptions of the characteristics of data and software (and provenance/workflow)

## Digital Scholarship

### Persistent identifiers:

For data, software, and authors (and provenance/workflow)

### Citations:

Citations for data and software (and provenance/workflow)

# Author Checklist

1

Data accessibility

2

Data documentation

3

Software accessibility

4

Software documentation

5

Provenance documentation

6

Methods documentation

7

Authors identification

- **For datasets**, the paper should include one or more citations, specifying the authors, the site where they are described and can be accessed, the repository, and the license.
- **For software**, the paper should include one or more citations, specifying the authors, the site where it is described and can be accessed, the repository, and the license.
- **For provenance and workflow**, the paper should include figures and traces, and if available the citations mentioning the authors, site to access them, the repository, and the license.
- **For authors**, there should be a unique identifier (e.g., ORCID)

- The Scientific Paper of the Future training materials were developed and edited by **Yolanda Gil (USC)**, based on the OntoSoft Geoscience Paper of the Future (GPF) training materials with contributions from the OntoSoft team including Chris Duffy (PSU), Daniel Garijo (UPM), Chris Mattmann (JPL), Scott Peckham (CU), Ji-Hyun Oh (USC), Varun Ratnakar (USC), Erin Robinson (ESIP)
- The OntoSoft training materials were significantly improved through input from GPF pioneers Cedric David (JPL), Ibrahim Demir (UI), Bakinam Essawy (UV), Robinson W. Fulweiler (BU), Jon Goodall (UV), Leif Karlstrom (UO), Kyo Lee (JPL), Heath Mills (UH), Suzanne Pierce (UT), Allen Pope (CU), Mimi Tzeng (DISL), Karan Venayagamoorthy (CSU), Sandra Villamizar (UC), and Xuan Yu (UD)
- Thank you to Ruth Duerr (NSIDC), James Howison (UT), Matt Jones (UCSB), Lisa Kempler (Matworks), Kerstin Lehnert (LDEO), Matt Meyernick (NCAR), Gail Clement (CalTech), and Greg Wilson (Software Carpentry) for feedback on best practices
- Thank you also to the many people that have taken the training and asked hard questions
- We are grateful for the support of the National Science Foundation and the EarthCube program

# GPF Pioneer Authors

**Cedric David**, NASA/JPL  
Hydrology modeling

**Ibrahim Demir**, U. of Iowa  
Hydrology sensor networks

**R. W. Fulweiler**, Boston U.  
Biogeochemistry in marine ecology

**J. Goodall/B. Essawy**, U.  
Virginia, Hydrology/visualization

**Leif Karlstrom**, U. Oregon  
Volcanic vent clustering

**Kyo Lee**, NASA/JPL  
Regional climate modeling

**Heith Mills**, U. Houston  
Geochemistry, marine biology

**Ji-Hyun Oh**, USC  
Tropical meteorology

**Suzanne Pierce**, UT Austin  
Hydrogeology for decision support

**Allen Pope**, U. Colorado  
Glaciology

**Mimi Tzeng**, Dauphin Island  
Sea Lab, Ocean fisheries

**Sandra Villamizar**, UC Merced  
River ecohydrology

**Xuan Yu**, U. Delaware  
Hydrologic modeling

## Scientific Paper of the Future

### Modern 'Paper'

#### Text:

Narrative of the method, some data is in tables, figures/plots, and the software used is mentioned.

#### Data:

Include data as supplementary materials and pointers to data repositories.

### Reproducible 'Publication'

#### Software:

For data preparation, data analysis, and visualization.

#### Provenance and methods:

Workflow/scripts specifying dataflow, codes, configuration files, parameter settings, and runtime dependencies.

### Open 'Science'

#### Sharing:

Deposit data and software (and provenance/workflow) in publicly shared repositories.

#### Open licenses:

Open source licenses for data and software (and provenance/workflow).

#### Metadata:

Structured descriptions of the characteristics of data and software (and provenance/workflow).

### Digital 'Scholarship'

#### Persistent identifiers:

For data, software, and authors (and provenance/workflow).

#### Citations:

Citations for data and software (and provenance/workflow).
